

Possible card sort outcome exercise

1. Stand the students in a circle.
2. Each student is given one of the cards from the sorting exercise — give them a moment to read it.
3. Start with the card “**Heat from the sun travels to the Earth as solar radiation**” (1). Ask the student holding the card to identify one of the other cards that it connects to (other students can suggest theirs).
4. A piece of string/rope is passed from the first card holder to the identified card holder (green line).
5. The process is repeated, until all the cards are connected — a card can be visited more than once if necessary (blue lines).
6. This should end with an interconnected web and lead on to the “What if...” questions.
